Task A – Application Understanding

QA Intern 24-Hour Assignment

Application Name	OomniEye – Digital Twin Solutions
Environment	Staging
Browser	Google Chrome
Testing Type	Manual Testing

1. Application Purpose

Based on my initial exploration, OomniEye appears to be a web-based dashboard application that provides users with different modules through a left-side navigation menu. The application contains a Dashboard, Reports, Theme Studio, Account Settings and notification functionality.

The Dashboard provides an overview of application-related information, while Theme Studio allows users to customize the appearance and branding of the application. Account Settings provides options related to personal information, security and user preferences.

2. Main Navigation and Important Modules

Dashboard

The Dashboard is the main landing page after accessing the application. I observed information sections including Performance Overview, Revenue, Open Orders, Inventory, Active Users, Revenue Trend and Recent Activity. The Dashboard appears to provide an overview of application-related information.

Reports – User

A User option is available under the Reports section. During detailed exploration, I observed a Users page with a Search field and Filter Columns functionality. These controls were considered for negative and edge-case testing. Sorting and export functionality were not assumed without verification.

Theme Studio

Theme Studio is used for customizing the application's appearance. I observed options such as Theme Settings, Colour Settings, Typography, Cards, Tables, Surface & Shape, Notifications and Login Screen.

Available theme presets observed were Corporate Blue, Emerald, Indigo Violet, Graphite, Ocean Teal and Amber.

Branding / Header

The branding section provides options related to Customer Logo, Show/Hide Customer Logo, Company Name, Caption, font settings, font size and weight, text colour, visibility and Save.

Footer

Footer customization includes Powered By, Text/Image option, Footer Visibility, Copyright text, Footer Links and Add Link.

Sidebar

Sidebar customization includes Sidebar colour, Start Expanded, Auto Hide Sidebar, Show Icons, Show Labels, Expanded Width and Collapsed Width.

Account Settings

Personal Information: profile picture, name, email, phone, department, organization and Edit Profile.

Security & Sessions: Active Sessions, Login History, Enable 2FA and Change Password.

Preferences & Privacy: Cookie Preferences, Language, Timezone, Privacy Policy, Terms of Service, Export Personal Data and Delete Account.

Notifications

The notification section provides Mentions, View All, Unread, a notification list and Previous/Next navigation. I also observed a project invitation notification with Accept and Decline actions.

3. Important End-to-End Workflows

Workflow 1 – Access to Dashboard

Access the staging application using the available assessment access → complete the available login/access step → application opens → Dashboard is displayed → user can view Dashboard information and navigate through the sidebar.

Business importance: Successful access to the application is required before the user can use other modules.

Workflow 2 – Customize Application Theme

Dashboard → Theme Studio → Select Theme → Configure Settings → Save → Verify appearance/preview.

Business importance: Theme Studio allows customization of the application's appearance and branding, so changes should be applied correctly without affecting usability.

Workflow 3 – Account and Security Management

Dashboard → Account Settings → review Personal Information → Edit Profile if required → review Security & Sessions → review Preferences & Privacy.

Business importance: Account and security settings contain user-related information and security controls, so they should be accessible and behave correctly.

4. Search, Filter and Sorting

During detailed exploration of the User Report / Users module, I observed a Search field and Filter Columns functionality. The Users page displays user data and provides options to search and apply filter conditions. Further testing was planned/performed for empty searches, invalid searches, special characters and filter conditions producing no results. Sorting behavior was not assumed without verification.

5. Create / Edit / Delete Actions

I observed an Edit Profile option under Account Settings. Theme Studio also provides configuration and Save actions for customization settings. Other create, edit or delete functionality was not fully confirmed during the initial exploration and was not assumed without verification.

6. Export / Download

An Export Personal Data option is available under Account Settings → Preferences & Privacy. The exact export format and downloaded content require verification. No other export/download functionality has been assumed without verification.

7. Audit History / Activity

The Dashboard contains a Recent Activity section. Account Settings also contains Login History under Security & Sessions. These provide activity/history-related information; exact recording behavior and retention details require further verification.

8. Assumptions / Unclear Requirements

- 1. Detailed functional requirements and acceptance criteria were not provided.

2. The exact purpose of Menu Item 1 and Menu Item 2 was unclear during exploration.

3. The expected file type and maximum file size for the Customer Logo were not confirmed.

4. It is not yet confirmed whether all Theme Studio changes remain after page refresh or a new login.

5. User roles and permission differences were not fully clear.

6. Search, filter and sorting behavior in User Report requires further verification.

7. The expected format/content of exported personal data needs to be verified.

8. Exact validation rules for profile and branding fields were not available.

9. Initial Observations

- The application loaded successfully in the staging environment.
- The left navigation provides access to the main available modules.
- The Dashboard provides several overview cards, charts and recent activity information.
- Theme Studio contains a wide range of customization options.
- Account Settings provides personal, security and privacy-related options.
- Notifications provide different views such as Mentions, View All and Unread.
- A project invitation notification provides Accept and Decline actions.
- User Report is available under the Reports section, with Search and Filter Columns controls observed during detailed exploration.
- Menu Item 1 and Menu Item 2 were visible in the navigation, but their functionality was not clear during initial exploration.
- A UI overlap issue was observed on the Users page where the report view panel overlaps part of the page content.
- Some requirements, such as validation rules, permissions and report functionality, need further verification through testing.
